Percentage of Care-Seeking Adults with Obesity (18 years and older)
By Census Tract, Metropolitan Denver, Colorado, 2016-2017

This map displays the percentage of care-seeking adults who are obese, as identified by CHORDS. Obesity is defined as a BMI, calculated from height and weight, of 30.0 kilograms per meter squared (kg/m²) or greater. The percentage of care-seeking adults who are obese was calculated by dividing the total number of adults with a BMI of 30.0 kg/m² or higher residing in a census tract by the total number of adults with a valid BMI measurement.

These data are comprised of care-seeking adults age 18 and older. The total number of adults represented with valid BMI measurements during the observation time period is 681,157, or 29% of the total adult population of 2,349,509, as reported by the latest 5-year American Community Survey. Census tracts are designated as having insufficient data if: 1) the total population in the census tract has fewer than 50 adults; or 2) fewer than 50 valid BMI measurements in the census tract were collected; or 3) coverage was less than 10% of the adult population.

For more information about how BMI is calculated please review the CHORDS BMI Adapter documentation.

Map Created March 2019. To request additional maps and/or aggregated data tables, please contact Greg Budney, CHORDS Project Manager for Public Health, at gregory.budney@dhha.org.

A list of participating CHORDS Data Partners can be found at www.chordsnetwork.org.

The Colorado Department of Public Health and Environment provides cartographic and web-based mapping services for CHORDS. This project is funded by The Colorado Health Foundation and the Adults and Child Consortium for Health Outcomes Research and Delivery Science.
Percentage of Care-Seeking Adults with Obesity (18 years and older)  
By Census Tract, Larimer and Weld Counties, Colorado, 2016-2017

This map displays the percentage of care-seeking adults who are obese, as identified by CHORDS. Obesity is defined as a BMI, calculated from height and weight, of 30.0 kilograms per meter squared (kg/m) or greater. The percentage of care-seeking adults who are obese was calculated by dividing the total number of adults with a BMI of 30.0 kg/m or higher residing in a census tract by the total number of adults with a valid BMI measurement.

These data are comprised of care-seeking adults age 18 and older. The total number of adults represented with valid BMI measurements during the observation time period is 55,173, or 12% of the total adult population of 473,009, as reported by the latest 5-year American Community Survey. Census tracts are designated as having insufficient data if: 1) the total population in the census tract has fewer than 50 adults; or 2) fewer than 50 valid BMI measurements in the census tract were collected; or 3) coverage was less than 10% of the adult population.
